

# Adaptive Platform Trial Scientific Meeting

September 28 – 29 • Toronto, Canada

## CanTreatCOVID

Canadian Adaptive Platform Trial of Treatments  
for COVID in Community Settings

# Enhancing the Efficiency of Adaptive Platform Trials Through the Exploration of Alternative Treatment Ranking Methods

Abigail McGrory<sup>1</sup>, Dr. Anna Heath<sup>1,2,3</sup>

Dalla Lana School of Public Health<sup>1</sup>, The Hospital for Sick Children<sup>2</sup>,  
University College London<sup>3</sup>

# Background

- Adaptive Platform Trials (APTs) allow for the evaluation of multiple interventions for a single disease
- The most common approach to compare interventions is to find the probability that each intervention is the best ( $P_{\text{best}}$ )
  - (ex. REMAP CAP, I SPY 2)
- This approach has been criticized because it does not take the full ranking distribution into account

# Research Goal

- Limited research has been done to determine if  $P_{\text{best}}$  is the most suitable ranking method or whether alternative methods exist
- Our goal is to identify the best way to compare multiple treatments in an APT to save time, resources, and ultimately patient lives

# Approach

16 papers reviewed; emphasis  
on network meta-analysis

10 potential ranking methods  
tested in R

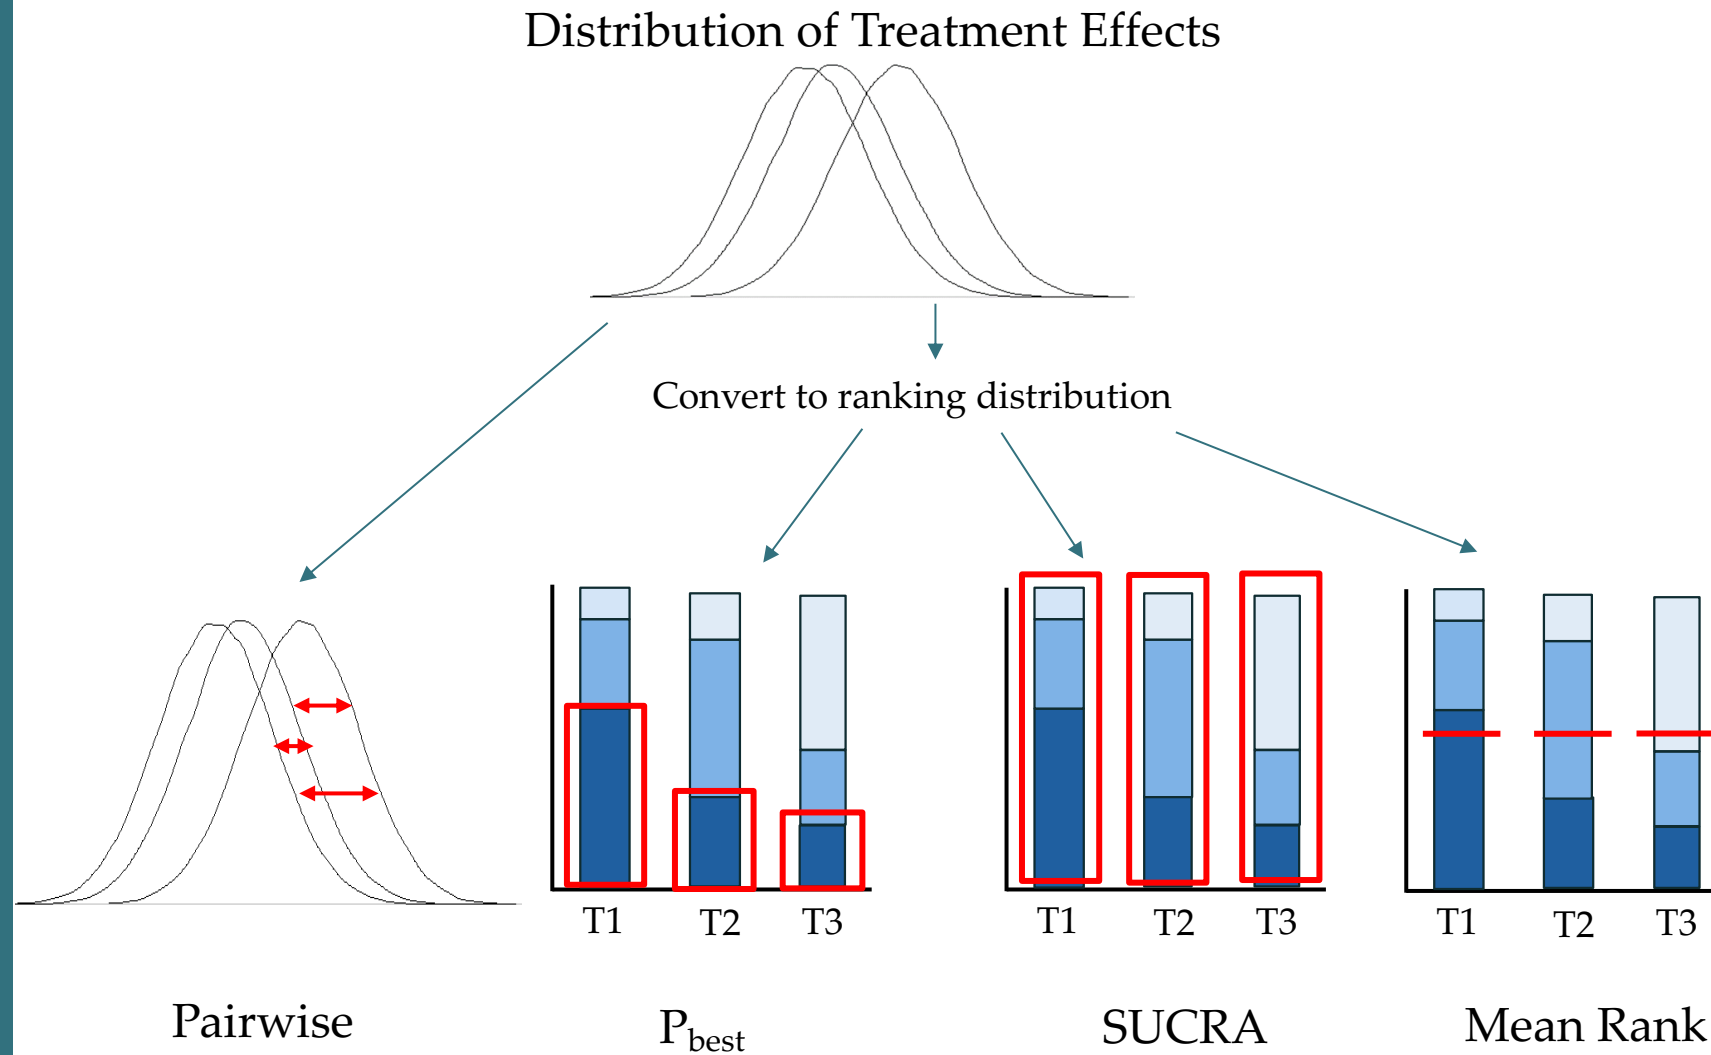

3 ranking methods identified  
as feasible

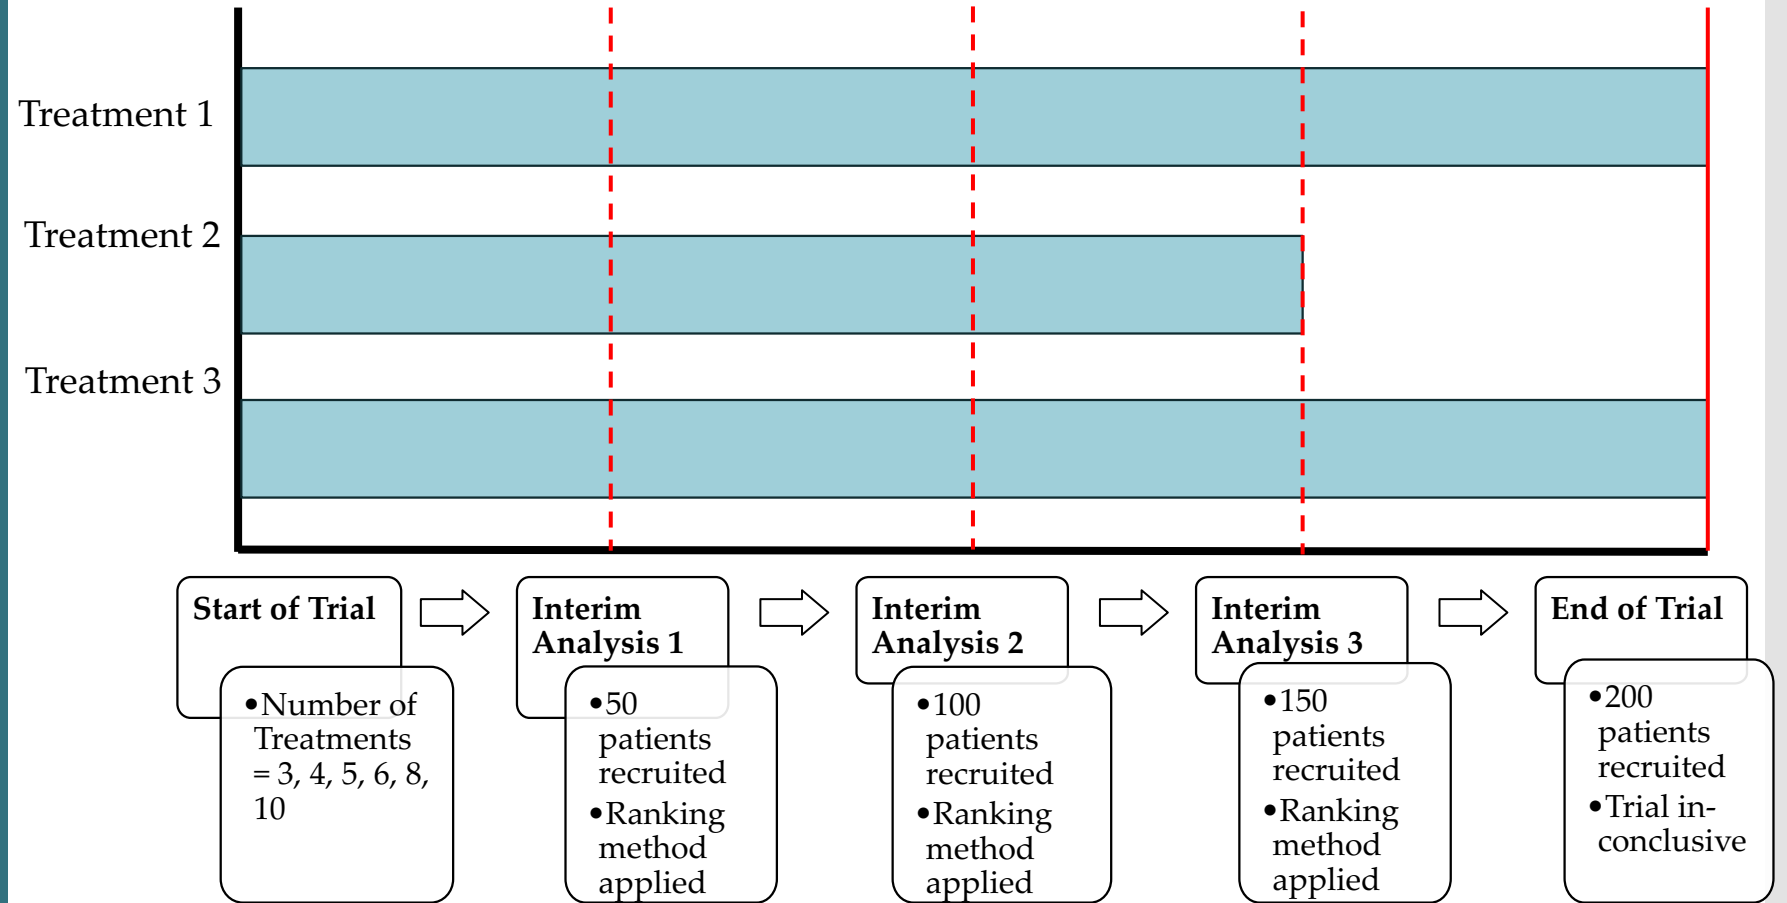

Simulation study to compare  
ranking methods to  $P_{\text{best}}$

# Ranking Methods

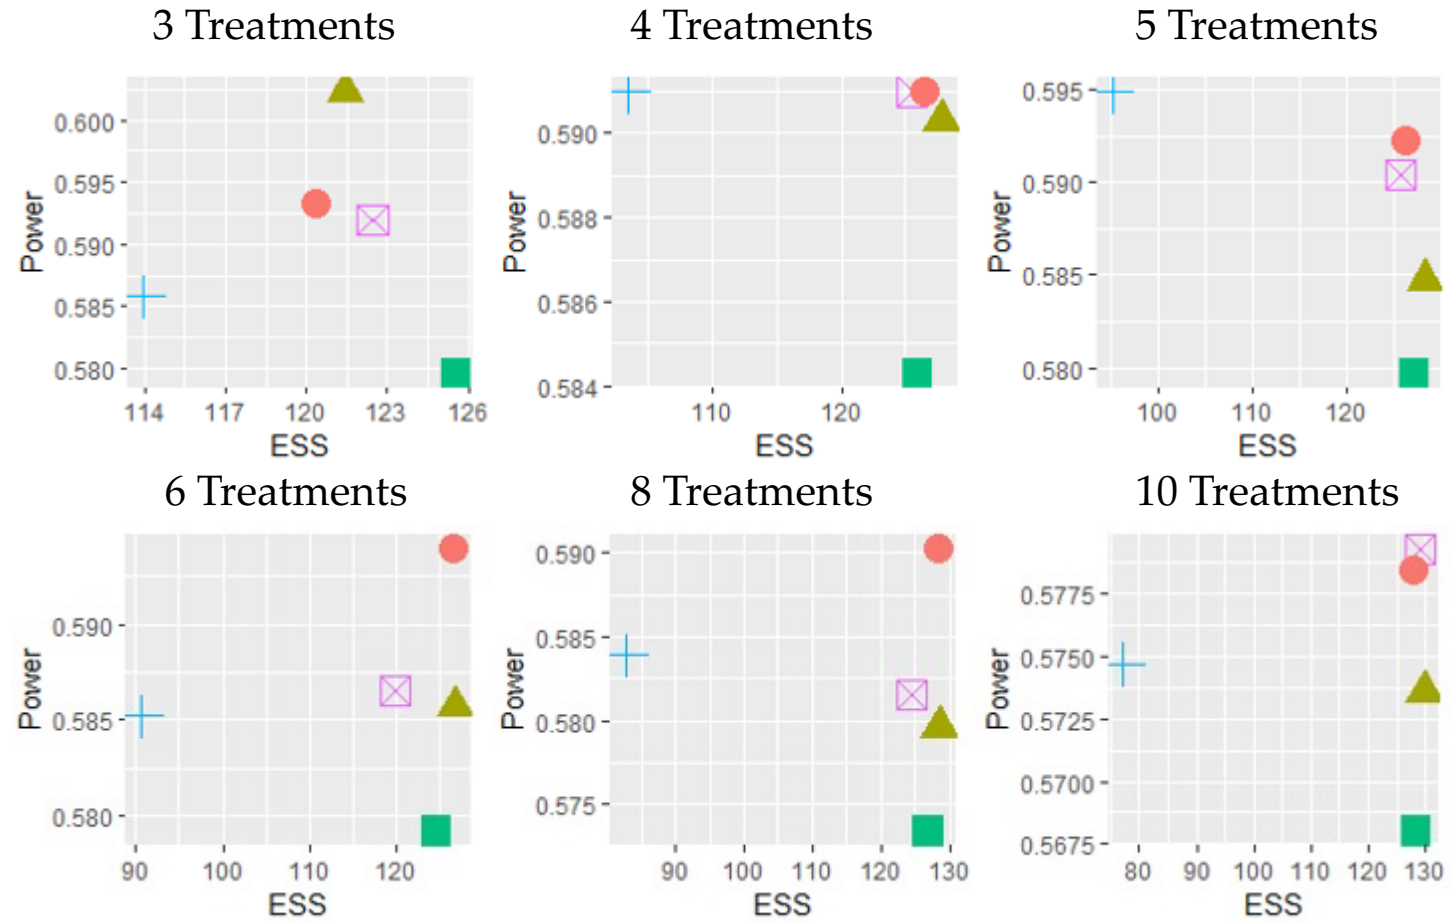

# Simulation Design

**Goal:** stop trial for futility or superiority

# Preliminary Results: Superiority

Power and Expected Sample Size (ESS) Per Method by Varying Number of Treatments

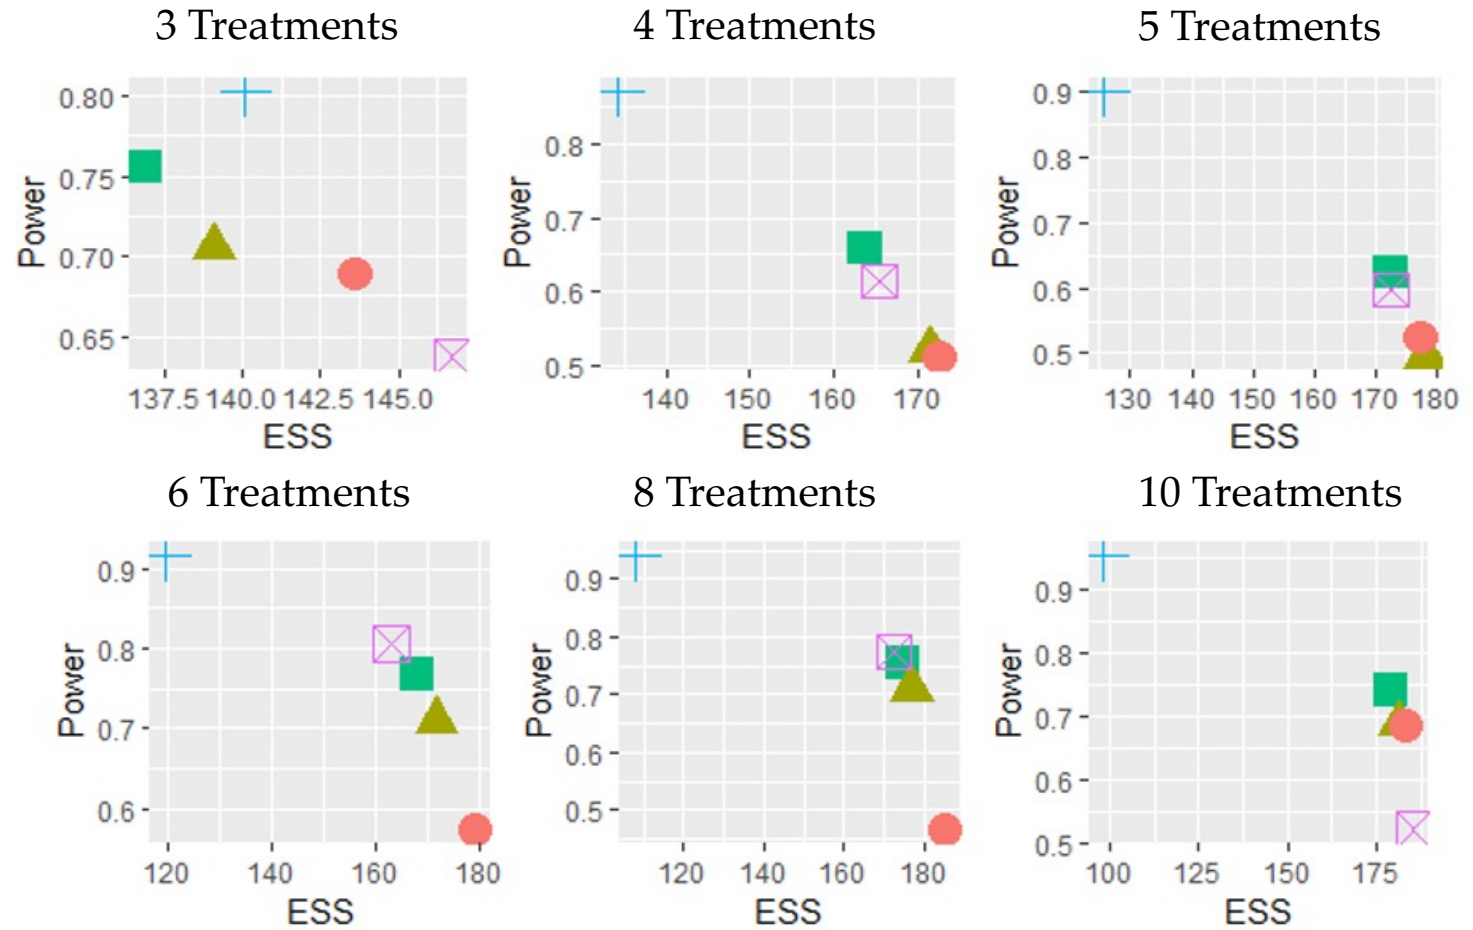

$P_{best}$ : +    SUCRA: ⊠    Pairwise (d=0): ▲    Pairwise (d=0.1): ■    Mean Rank: ●

# Preliminary Results: Futility

Power and Expected Sample Size (ESS) Per Method by Varying Number of Treatments

$P_{best}$ : + SUCRA: x Pairwise (d=0): ▲ Pairwise (d=0.1): ■ Mean Rank: ●

# Conclusion & Next Steps

- **Conclusion**
  - $P_{\text{best}}$  performs best in terms of power and expected sample size for superiority and futility scenarios
  - Alternative ranking methods have been identified and could be useful in practice
- **Next Steps**
  - Extend to trials with non-normal outcomes
  - Increase complexity of trial design (i.e. add treatment arms during the trial)
